Unlocking the agricultural systems The example of agroecological research and innovation systems

Philippe Baret Earth & Life Institute Université catholique de Louvain

Université catholique de Louvain

- Development of new varieties and new machinery
- Better use of inputs
- Main goal : increase of productivity and efficiency
 - impact on productivity -> increase yield
 - impact on sustainability -> decrease impact

³ | From XXth to XXIst century A triple agenda

- Food systems must ensure the availability of food for everyone
- Agriculture must develop in ways that increase the incomes of smallholders
- Agriculture must not compromise its ability to satisfy future needs

Report submitted by the Special Rapporteur on the right tofood, Olivier De Schutter (UN, 2010)

4 | How to meet these challenges ?

- upgrade from yield to income, welfare and ecosystems services
 - From field to farm and food system.

5 | How to meet these challenges ?

- upgrade from yield to income, welfare and ecosystems services
 - from plot/field to farm/system.
- think about trade-offs between productivity and sustainability
 - from maximisation to optimisation

Trade-offs are the reality of biological systems We have to decide our priorities and accept trade-offs Triple win (eco, social, envi) is an utopy

Examples of trade-offs

- income/labor
- yield/cost
- quantity/quality
- yield/price
- resilience/speculation
- farm/post farm share

6 | How to meet these challenges ?

- upgrade from yield to income, welfare and ecosystems services
 - from plot/field to farm/system.
- think about trade-offs between productivity and sustainability
 - from maximisation to optimisation
- take advantage of the the specificities of system approaches

7 | Specificities of system approach

- System approach
 - A question of method
 - Focus on interactions
 - Address the issue of complexity
 - Able to accomodate a diversity of prospective scenarios

8 | Example of system approach

35

source : Conway, Agroecosystem analysis, 1983

9 | Specificities of system approach

- System-wide scale
 - A question of scale
 - Widening the scope
 - A more comprehensive understanding of reality
 - More degrees of freedom for trade-offs
 - Prerequisite for a multi-actor process of innovation

10 | Shifts to address the new challenges

Change of indicators

- from yield to income and welfare
- sustainability indicators

• Importance of farmer's decision

- tradeoffs —> a system approach
- from plot to farm & value chain

11 | Shifts

Change of indicators

- from yield to income and welfare
- sustainability indicators

Importance of farmer's decision

- a system approach
- from plot to farm to value chain

12 From XXth to XXIst century

• More challenges ...

- access to sufficient and healthy food for all
- insure a fair income to farmers
- make farming systems sustainable in the future

13 From XXth to XXIst century

• More challenges ...

- access to sufficient and healthy food for all
- insure a fair income to farmers
- make farming systems sustainable in the future

... more options

- sustainable intensification of conventional systems
- organic farming
- agroecology

14 **A diversity of pathways**

She can feed a hungry planet. We're going to help her do it.

syngenta

Sustainable intensification

What Beth needs is access to the technology, skills and resources that can help her get more from her land.

As one of the world's leading agricultural companies, Syngenta is committed to helping farmers access the world **to raise yields while conserving water, soil and ecosystems**. It's all part of what we call the Good Growth Plan.

15 | Agroecology : principles inspiring practices

FARM

- Agroecology is based on principles
 - sun, soil and water as the main drivers of agricultural production
 - recycling, limitation of impacts, parsimonious use of energy

-> take advantages of ecosystem services

Autonomy of decision of farmers

-> shift from a plot to a system level : the farm

-> from maximisation to optimisation

Socio-economic principles

- fair trade, cooperation, support of customers ...
 - —> gaining in economic autonomy to have the opportunity to build on ecosystem services and insure food sovereignty,

Agroecology uses **ecological concepts and principles for the design and management of sustainable agroecosystems** where external inputs are replaced by natural processes such as natural soil fertility and biological control (Altieri 1995)

source : Stassart et al., 2012 ; Dumont et al., 2016

Principles Practices •Plant nutrition •Enhance recycling of biomass • Optimize nutrient availability Agroforestry •Balance nutrient flows Soil management **Conservation** •Securing favorable soil conditions for plant growth •Manage organic matter agriculture • Enhance soil biotic activity •Parsimony in ressource use Organic • Minimize losses of resources farming • Microclimate management, water harvesting and soil management through increased soil cover **Biological** •Genetic diversity Species and genetic diversification control •Biological control •Enhance beneficial biological interactions and synergisms **Crop-livestock** among agrobiodiversity components integration Promote key ecological processes and services

17 | The nature of innovation

Efficiency

- increase the benefit/cost ratio
- example : fertilizers, precision farming, ...
- Substitution
 - substitute low impact inputs to high impact inputs
 - example : organic manure, biological control,

Redesign

- reconfigure the farming system to take full advantage of ecosystem services
- example : permaculture, agroforestry, ...

¹⁸ The nature of innovation

- Efficiency
 - increase the benefit/cost ratio
 - example : fertilizers, precision farming, ...
- Substitution
 - substitute low impact inputs to high impact inputs
 - example : organic manure, biological control,
- Redesign
 - reconfigure the farming system to take full advantage of ecosystem services
 - example : permaculture, agroforestry, ...

¹⁹ | Relevant innovations for sustainability are not implemented : why ?

• State of the art

- agroecological practices are known but poorly implemented
- the most sustainable systems are weakly invested by research
- the minimal requirements of a sustainable horizon are not clearly stated
 - what is the equivalent of the 2°C threshold for agriculture ?

Exemples of lock-ins

- use of chemical pesticides
- associations of cereals and legumes
- dairy production & standardisation
- ...

20 | Ecophyto 2018

- Target : 50 % of pesticide use from 2008 to 2018
- Annual budget : 40 Mio €
- Results : 2009-2013 : +13 %
- Action based on good practices at plot and farm level
- Demonstration farms (Dephy network)
 - 2012 : 7 %
 - 2013 : 12 %
- Ecophyto II : more money (70 Mio €) for the same actions

- 21 **Fungus disease in wheat**
- mixtures of variety vs. fungicides

²² | Most of the innovations are already available but not implemented : why ?

Factor of lock-ins

- related to process
 - path dependency, complexity, competition between pathways
- related to actors
 - Matthew's effect, lobbies, vision of efficiency and progress ...
- related to system
 - lack of vision on the co-existence of systems and the mechanisms of transition

24 Key elements for unlocking

- A participatory multi-actor approach of innovation
- An acknowledgment of the diversity of pathways
- A shift from plot to farm and food systems
- Integration of cultural dimension & education

25 Key elements for unlocking

- A participatory approach of innovation
- An acknowledgment of the diversity of pathways
- A shift from plot to farm and food systems
- Integration of cultural dimension & education
- A significant funding of research for alternative systems
 - New pathways means new assessment methods and new experts
 - Share of funding for organic farming research is decreasing at EU level *
- A prospective approach of agriculture to get out of path dependency
- More emphasis on system approaches

Research for transition : What kind of research do we need to make European farming and food systems sustainable?
